RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 52 pages. This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1980 Excerpt: . . . (hand calculated), are too low. VHF rms slopes that exceed S-band rms slopes would not be expected. Clearly, roughness increases with decreasing scale length. However, if the two radars act as a filter and measure roughness contributions between two different scale-length increments, such a result is possible. Despite some minor inconsistencies, the bistaticradar results are very good: (1) The roughness estimates agree with the visual and photographic evidence for the Moon and are consistent with the geologic map units, (2) the combination of radar roughness, albedo, and infrared eclipse temperatures could be used to produce maps of the Moon which would, in general, resemble the distribution of the major terrain types, (3) the results on slope-probability distributions obtained by the radar are in general agreement with those obtained using photographs and photogrammetric techniques. EARTH-BASED RESULTS REFLECTION OF SOLAR RADIATION WITH WAVELENTH FROM 0. 3 fiM TO 2. 2 iM By Gerald G. Schaber The methods of photometry, polarimetry, colorimetry, and spectral reflectivity have been applied to reflected lunar light since early in the present century to obtain data on the physical and chemical composition of the lunar surface. The four techniques for optical characterization of the Moon will be summarized with reference to its major geologic significance in this section. Each of these techniques complimented one another and provided the basis for the resurgence since the Apollo missions of interest in high-resolution spectral reflectivity variations as they relate to chemical composition of the Moon. They form a useful basis for extrapolation...
